

## Energy Saving in Private Households

7500 kWh/Jahr

ca. 750 l Heizöl

jährlicher  
Heizenergieverbrauch  
eines Einfamilienhauses mit  
Niedrigenergiestandard

10.000 kWh/Jahr

ca. 1000 l Benzin

Fahrt zur Arbeit:  
täglich 2 x 25 km mit einem  
Mittelklassewagen

Christoph Wendel  
09.11.2005

# Initial Situation

- **64%** of primary energy can be used - private households use **30%** of final energy

**77%** ambient heat  
**11%** hot water  
**7%** mech. energy  
**4%** process heat  
**2%** lighting

possibilities:

- **raise** of efficiency or **decrease** of consumption

**more efficient generation of final energy (condensing boiler)**  
**use of other sources (photo-thermic, geothermic, district heating)**

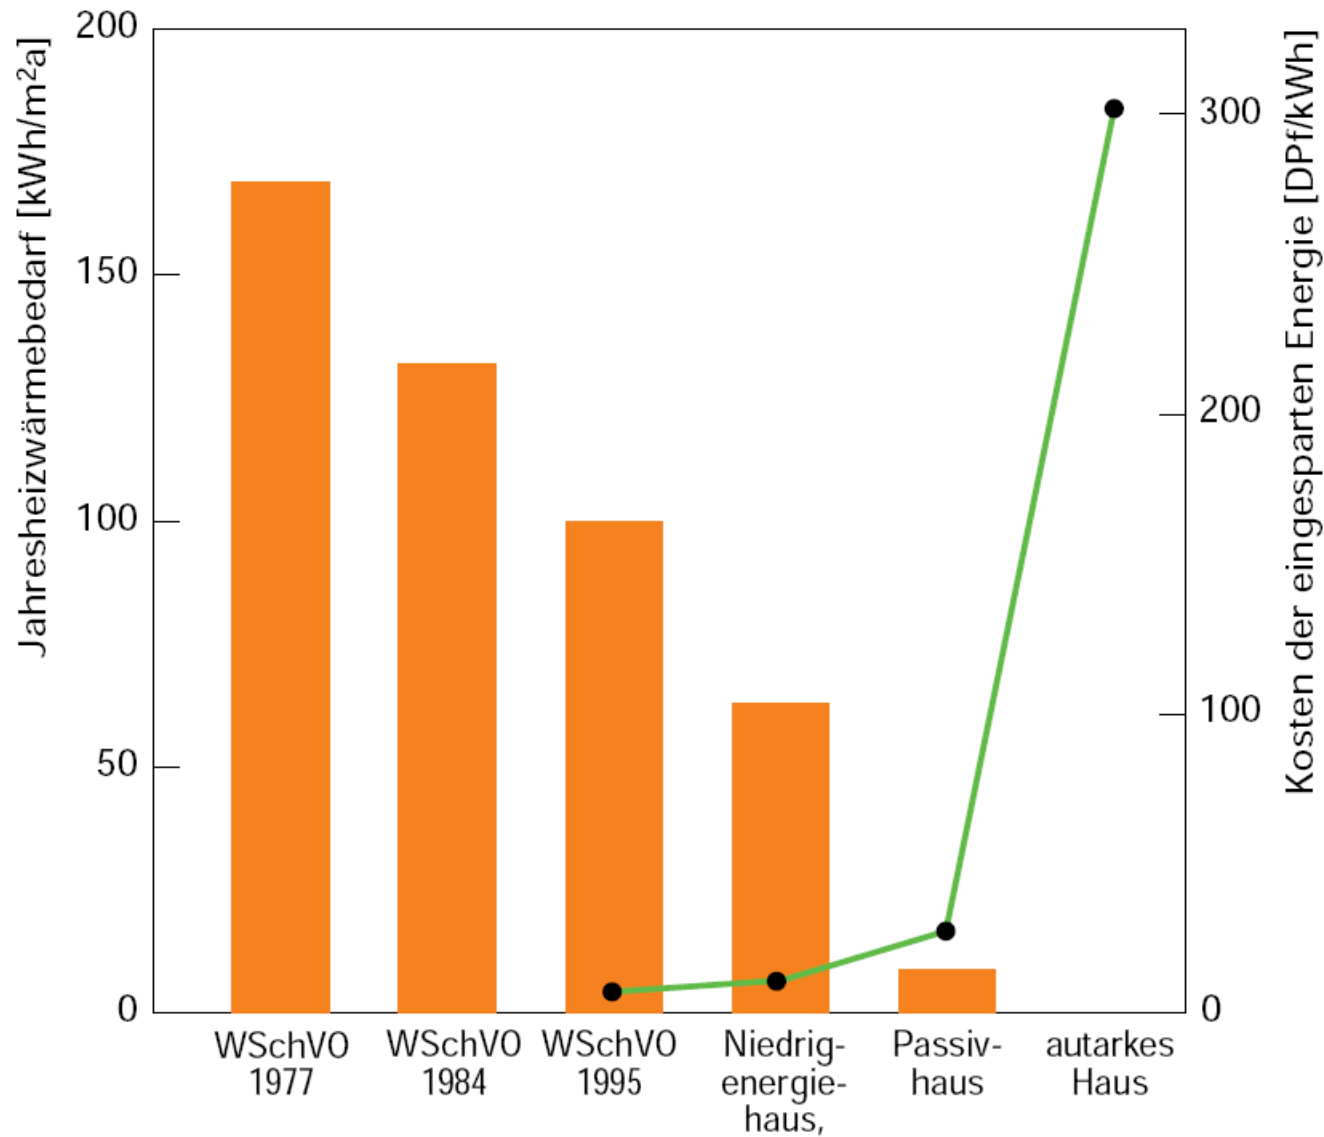

**buffering**  
**insulation**

- primary source for energy saving is ambient heat and hot water

ambient heat:      **34%** Gas (p)  
                         **26%** Oil (p)  
                         **5%** district heating (f)  
                         **3%** electrical power (f) (electrical needs 3x more primary energy)

# Typical Consumption

typical household consumes **90-150 kWh/(m<sup>2</sup> a)** / 120 Mwh/a (Stat. Bundesamt) -- ( 70kWh/(m<sup>2</sup>a) )

passive house: **10-15 kWh/m<sup>2</sup> a**

# Losses

## losses:

structure design / location ( wind / sun ...)

heat conduction (U-value): **x** W/(m<sup>2</sup>K)

### walls:

30 cm concrete wall	3
normal wall (cavity bricks)	0,42
wall w. external insulation	0,28
leightweight construction	0,19

### windows:

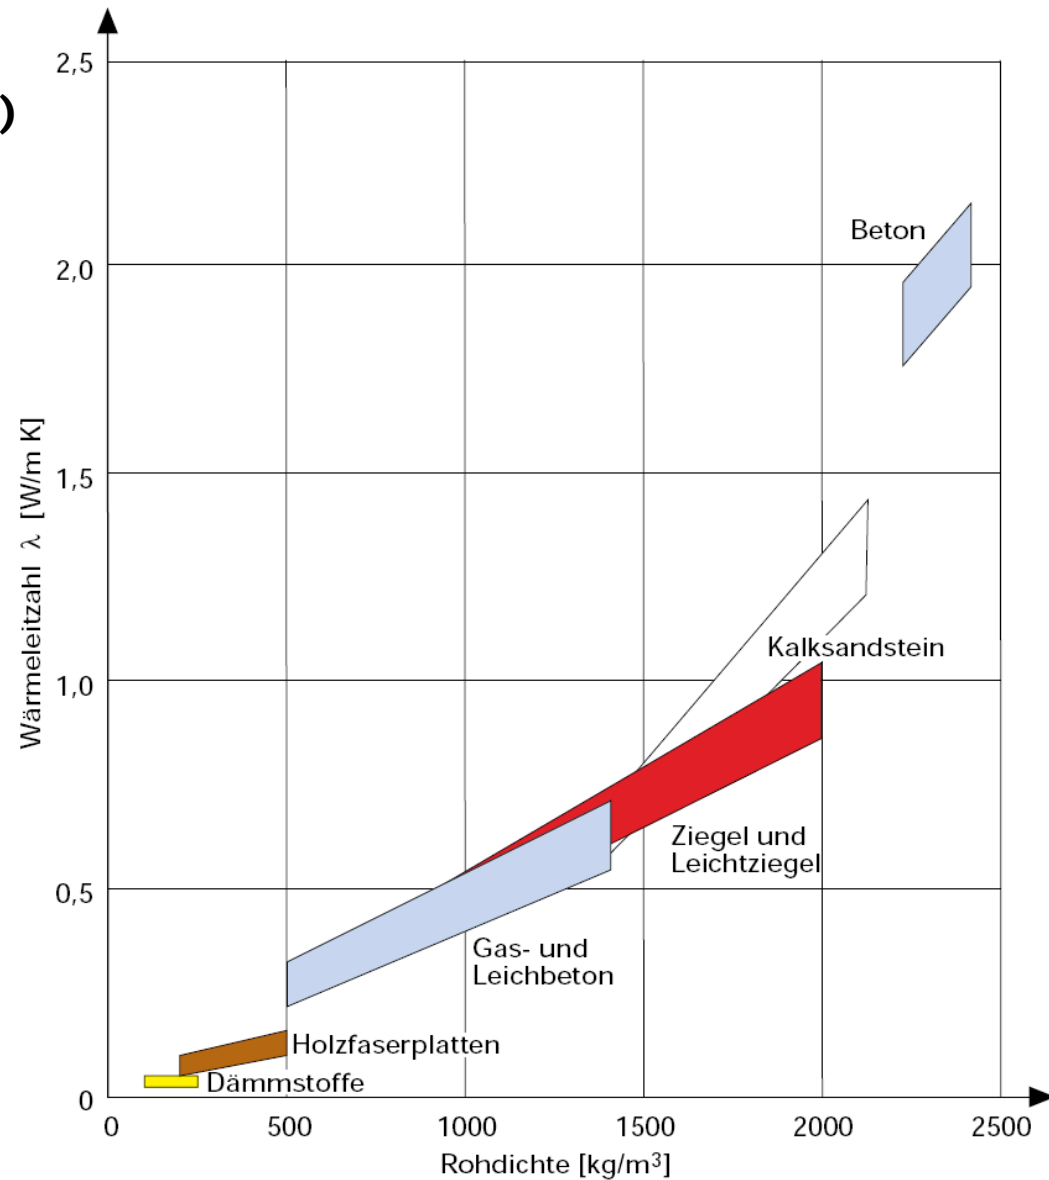

single glazing	6
double glazing	3
dg with heat insulation	2
tripple h. i. with Krypton	0,8

U=1 equals 10 l oil per year and m<sup>2</sup>

### ventilation:

window ventilation  $T_{in} = T_{outside}$  ,  $T_{out} = T_{amb}$

central ventilation with heat recovery ( $T_{out} = T_{in} + 2^{\circ}\text{C}$ )

# Energy Production / Buffering

## production:

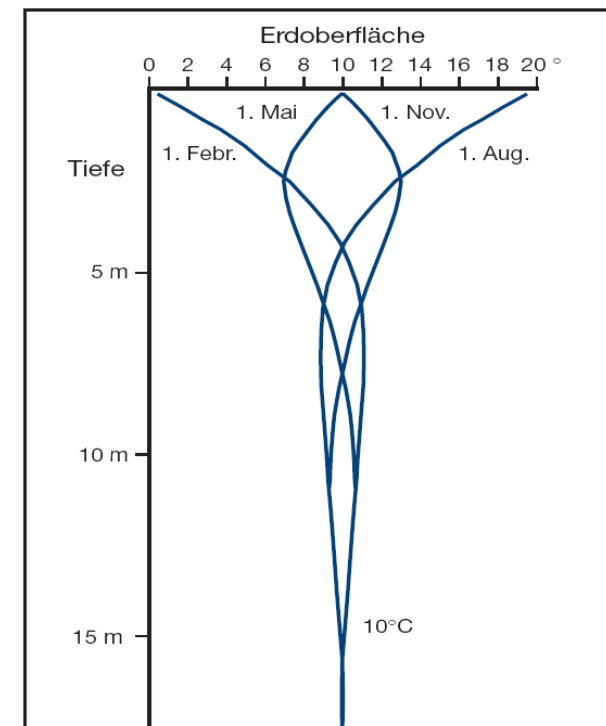

normal boiler      75-90 %      of primary energy used for heating/hot water  
condensing boiler   105 %      (uses condensation heat after the combustion)

## distribution:

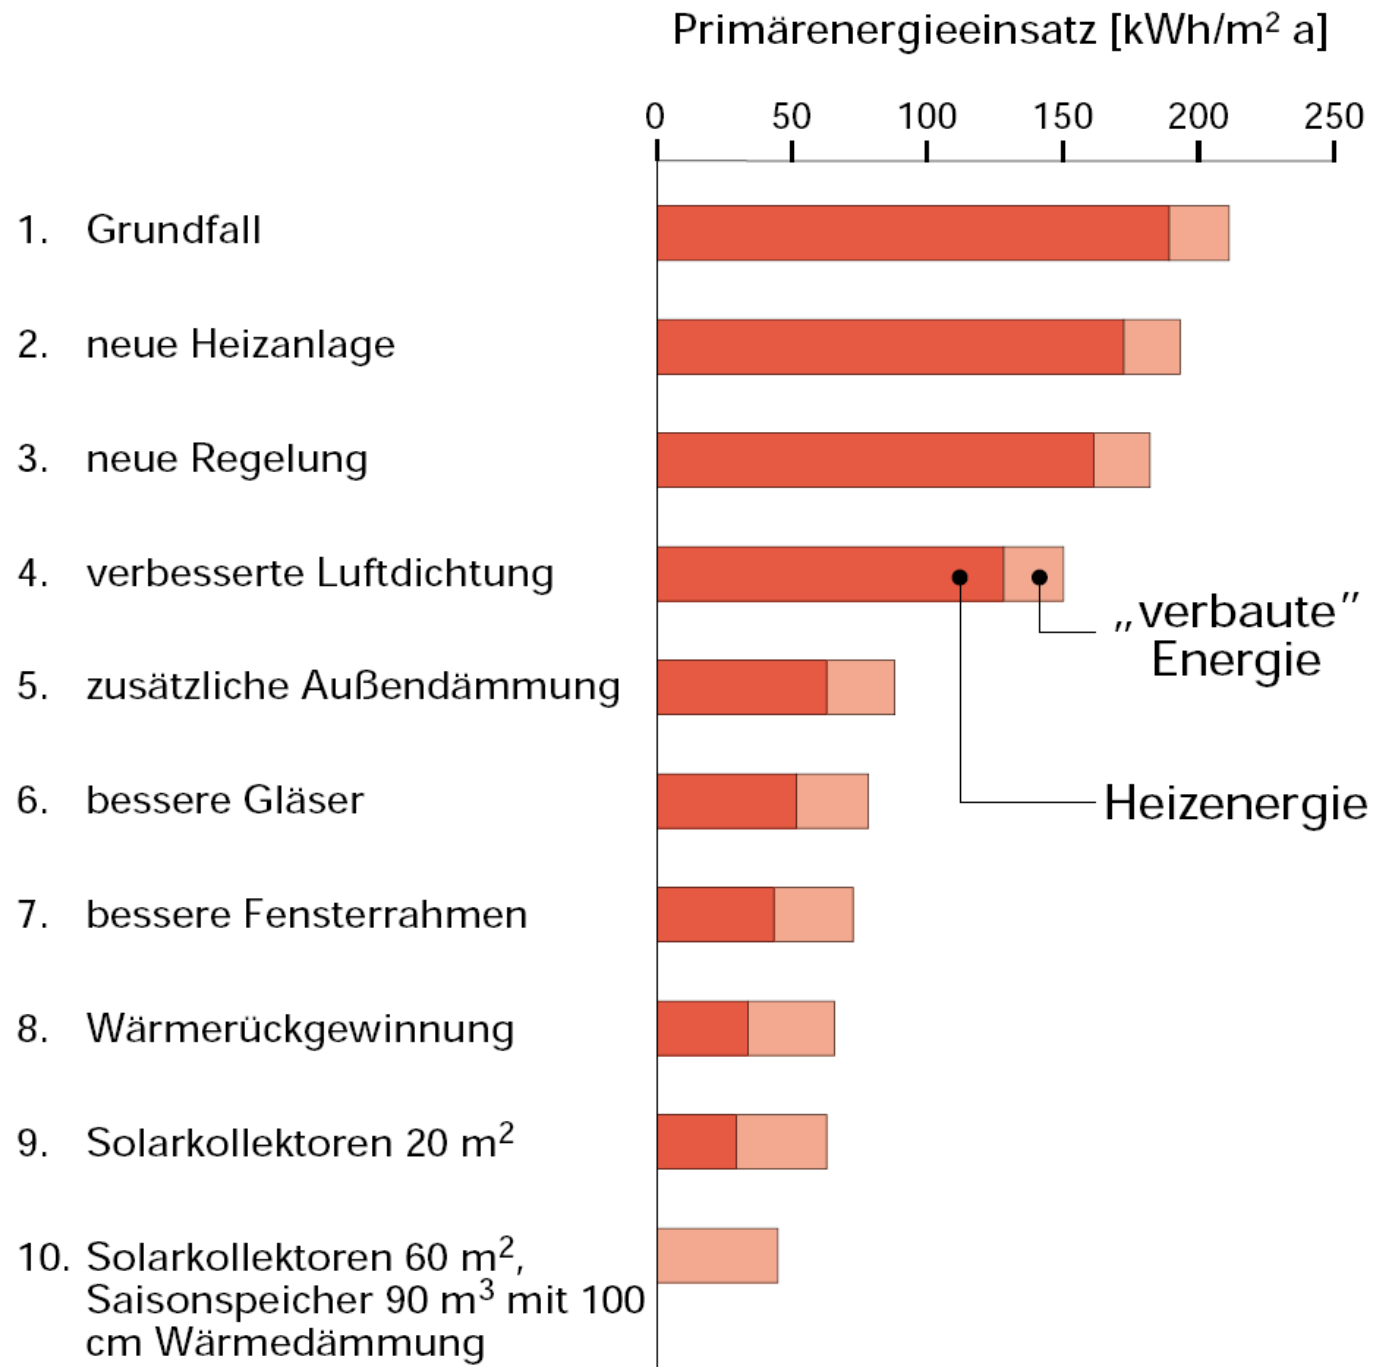

radiator heating:      55°C/45°C (VL/RL)  
heat mat:              35°C/32°C  
concrete core heating: 25°C/23°C

## energy buffer / energie source:

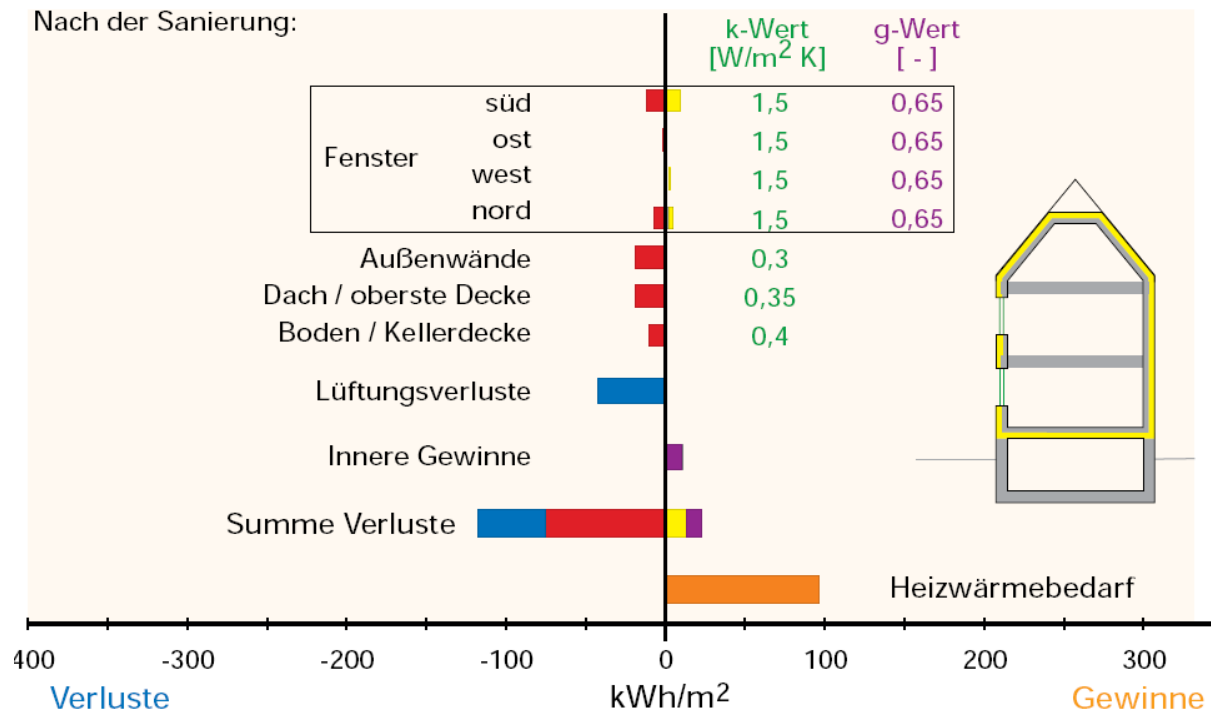

photo-thermic hot water  
geo-thermic energy buffer/source

# Example 1: From Normal to Passive House

# Example 2: Renovation (1995!!)

# Example(s) 3: Different Houses

Schloßberg 2, Monschau

Violengasse 14-20, Düren

Niebelungenring, Leipzig

Am grauen Stein, Köln

Auenstraße 20, Leipzig

Typ MELB 509, Magdeburg

# Renovation: Detailed View

## Energiebilanzen heute und morgen

Beispiel: Mehrfamilienhaus „Violengasse 14-20“ in Düren
