

Lecture Outline

- Volcanic Eruption Emission and Ejecta
- Eruption Classifications
- Tectonic Plate Boundaries and Hotspots

- Impact on Global climate
- Effects of gas injection into atmosphere

- Supervolcanoes
- Long term global effects

Nora Strotjohann - Maike Hansen - Victor Rufus 2

Volcanic Explosive Index (VEI)

$VEI = \log_{10}(\text{Raised Pyroclastic Material}[\text{kg}]) - 7$

VEI	Description	Plume	Frequency	Examples	Occurrences in last 10,000 years*
0	effusive	< 100 m	constant	Kilauea, Piton de la Fournaise	many
1	gentle	100-1000 m	daily	Stromboli, Nyiragongo (2002)	many
2	explosive	1-5 km	weekly	Galeras (1993), Mount Sinabung (2010)	3477*
3	severe	3-15 km	few months	Nevado del Ruiz (1985), Soufrière Hills (1995)	868
4	cataclysmic	10-25 km	≥ 1 yr	Mount Pelée (1902), Eyjafjallajökull (2010)	421
5	paroxysmal	20-35 km	≥ 10 yrs	Mount Vesuvius (79 CE), Mount St. Helens (1980)	166
6	colossal	> 30 km	≥ 100 yrs	Krakatoa (1883), Mount Pinatubo (1991)	51
7	super-colossal	> 40 km	≥ 1,000 yrs	Thera (Minoan Eruption), Tambora (1815)	5 (+2 suspected)
8	mega-colossal	> 50 km	≥ 10,000 yrs	Yellowstone (6-40,000 BP), Toba (74,000 BP)	0

Nora Strotjohann - Maike Hansen - Victor Rufus 3

Volcanic Emissions and Ejecta

- Tephra
- Pyroclastic Flow
- Lava Flows
- Lahars
- Plume

Nora Strotjohann - Maike Hansen - Victor Rufus 4

Tephra

- Pyroclastic fragments classified by size
- **Ash** - particles smaller than 2 mm in diameter
- **Lapilli** - between 2 and 64 mm in diameter
- **Volcanic Bombs** - larger than 64 mm in diameter.

Examples of Ignimbrite Tuff

Nora Strotjohann - Maike Hansen - Victor Rufus 5

Pyroclastic Flow

- Pyroclastic Density Current (PDC)
- Superheated gaseous current
- Gravitationally driven
- Temperature < 1300K, Velocity < 700km/h
- Caused by:
 - i. Collapse of the eruption column or lava dome or spine
 - ii. Directional blast when side of volcano explodes

Nora Strotjohann - Maike Hansen - Victor Rufus 6

Lava Flows and Fountains

- Igneous rock expelled from a volcano during an eruption
- Can also be caused by increase in crustal compression stress
- Chemical composition determines viscosity and temperature
- Classified into three chemical types
 - i. Felsic (rich in SiO₂)
 - ii. Andesitic (rich in Mg and Fe)
 - iii. Mafic (low in SiO₂)

Mauna Ulu eruption, Kilauea Volcano, Hawaii

Nora Strotzjohann - Malke Hansen - Victor Rufus

Lahars

- Contraction of "Belahar", Indonesian for "Volcanic Mudflow"
- Debris flow consisting of pyroclastic material and water
- Can travel up to 100km/h and for up to 300km
- Follows the local topography for direction, mostly through river valleys
- Occur in tropical or glacial regions
- Snow and glacier melt or rainfall and typhoons contribute to the water content

Galunggung, Indonesia

Nora Strotzjohann - Malke Hansen - Victor Rufus

Plume

- Eruption column
- Hot volcanic ash emitted by an explosive eruption
- Height < 10km, plume is washed out by rainfall
- > 10km, penetrates stratosphere with ash and volcanic gases.

Mount St. Helens, USA

Nora Strotzjohann - Malke Hansen - Victor Rufus

Classifications of Eruptions

	VEI
• Hawaiian	0-1
• Strombolian	1-2
• Vulcanian	2-3
• Peléan	3-4
• Plinian *	4 and above

*Includes Ultra-Plinian and Supervolcanic

Nora Strotzjohann - Malke Hansen - Victor Rufus

10

Hawaiian Eruption

- VEI of 0 – 1
- Effusive eruptions of very fluid basaltic lava flows
- Plume < 1000m, comprising mostly ash
- Typical eruptions from the Hawaiian Islands Hotspot

Nora Strotzjohann - Malke Hansen - Victor Rufus

11

Strombolian Eruption

- VEI of 1 – 2
- Driven by gas bubbles created by a decrease in crustal compression stress
- Gentle eruptions with Plume consisting of all types of tephra, < 3 km

Yasur Volcano, Vanuatu

Nora Strotzjohann - Malke Hansen - Victor Rufus

12

Vulcanian Eruption

- VEI of 2 – 3
- More explosive than Strombolian eruption
- Tephra dispersed over wide area, ash volcanic cone and lava flows
- Plume < 10 km

Tavurvur Volcano, Near Rabaul, PNG

Nora Strotzjohann - Malke Hansen - Victor Rufus 13

Peléan Eruption

- VEI 3 – 4
- Avalanches of glowing hot ash flows
- Tephra deposits less widespread than Vulcanian and Plinian eruptions
- Plume < 20 km

Mayon Volcano, Phillipines

Nora Strotzjohann - Malke Hansen - Victor Rufus

Plinian Eruption

- VEI 4 and above
- Cataclysmic explosions
- Plumes up to 45km in height and can penetrate the stratosphere
- Large amount of tephra ejected
- Felsic lava flow

Redoubt Volcano, Kenai Peninsula, Alaska, USA

Nora Strotzjohann - Malke Hansen - Victor Rufus

Where volcanoes systems occur?

- Divergent Plate Boundaries
- Convergent Plate Boundaries
- Hotspots

Nora Strotzjohann - Malke Hansen - Victor Rufus 10

Divergent Plate Boundaries

- Volcanoes occurs predominantly within oceanic regions
- Iceland, best example of diverging oceanic plates breaching sea level

Nora Strotzjohann - Malke Hansen - Victor Rufus 17

Divergent Plate Boundaries

- Eyjafjallajökull, Iceland

Nora Strotzjohann - Malke Hansen - Victor Rufus 18

Convergent Plate Boundaries

- Oceanic – Continental Subduction Zone
- Resulting in mountain ranges and volcanoes on continental plates

Nora Strotzjohann - Malke Hansen - Victor Rufus

19

Convergent Plate Boundaries

- Oceanic – Oceanic Subduction Zone
- Creates Volcanic Arcs

Nora Strotzjohann - Malke Hansen - Victor Rufus

20

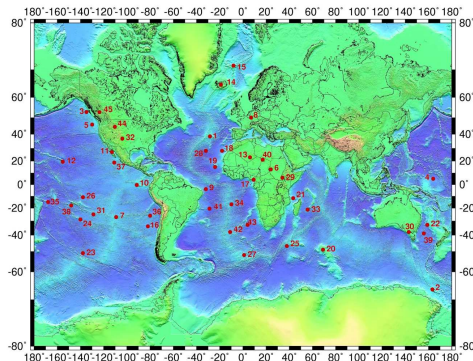

Convergent Plate Boundaries

- **Mt Vesuvius** (erupted 79 AD), VEI=4 Apennines Subduction System
- **Pinatubo** (1991) VEI=6, formed by the Philippine Mobile Belt sliding over the Eurasian Plate along the Manila Trench to the west
- **Lake Toba** (74 000 BP) VEI=8, part of the Sunda Arc, a result of the northeasterly movement of the Indo-Australian Plate which is sliding under the eastward-moving Eurasian Plate
- **Mount Tambora** (1815) VEI=7, on the island of Sumbawa, Indonesia, is flanked both to the north and south by oceanic crust. This raised Mount Tambora as high as 4,300 m (14,100 ft), formerly one of the tallest peaks in Indonesian archipelago.

Nora Strotzjohann - Malke Hansen - Victor Rufus

21

Hotspots

Nora Strotzjohann - Malke Hansen - Victor Rufus

22

Hotspots

- Yellowstone (640 000 BP) VEI=8
- Hawaiian Hotspot

Nora Strotzjohann - Malke Hansen - Victor Rufus

23

Impact on Global Climate

Nora Strotzjohann - Malke Hansen - Victor Rufus

24

Volcanic Explosion Index

VEI	Description	Plume	Frequency	Examples	Occurrences in last 10,000 years*
0	effusive	< 100 m	constant	Kilauea, Piton de la Fournaise	many
1	gentle	100-1000 m	daily	Stromboli, Nyiragongo (2002)	many
2	explosive	1-5 km	weekly	Galeras (1993), Mount Sinabung (2010)	3477*
3	severe	3-15 km	few months	Nevado del Ruiz (1985), Soufrière Hills (1995)	868
4	cataclysmic	10-25 km	≥ 1 yr	Mount Pelée (1902), Eyjafjallajökull (2010)	421
5	paroxysmal	20-35 km	≥ 10 yrs	Mount Vesuvius (79 CE), Mount St. Helens (1980)	166
6	colossal	> 30 km	≥ 100 yrs	Krakatoa (1883), Mount Pinatubo (1991)	51
7	super-colossal	> 40 km	≥ 1,000 yrs	Thera (Minoan Eruption), Tambora (1815)	5 (+2 suspected)
8	mega-colossal	> 50 km	≥ 10,000 yrs	Yellowstone (6-40,000 BP), Toba (74,000 BP)	0

Nora Strotzjohann - Malke Hansen - Victor Rufus

25

Emitted gases

- Only injection in stratosphere (8 – 18km height) has to be considered, otherwise washed out by rain
- Mainly H₂O and CO₂ (greenhouse gases)
- Sulfur → most important impact
- Chlorine and others in small amounts

Nora Strotzjohann - Malke Hansen - Victor Rufus

26

The Greenhouse Effect

- Mainly water vapor, CO₂, methane, N₂O
- Emissions by volcanoes normally > 1% compared to human-made CO₂
- Cooling due to aerosols (sulfur) dominates

Nora Strotzjohann - Malke Hansen - Victor Rufus

27

Sulfur Emissions

Nora Strotzjohann - Malke Hansen - Victor Rufus

28

Sulfur Emissions

Nora Strotzjohann - Malke Hansen - Victor Rufus

29

Pinatubo Aerosol Cloud

Nora Strotzjohann - Malke Hansen - Victor Rufus

30

Sulfur Acid Aerosols

Aerosol = liquid/solid particle that floats in gas

- sulfur + water → sulfur acid (70:30)
- Icy or liquid spheres with $d \sim 500$ nm
- solar radiation is absorbed, scattered or reflected → increased albedo
- Slowly settle down during the next 1-3 years

Nora Strotzjohann - Malke Hansen - Victor Rufus

31

Iceland 2010

Nora Strotzjohann - Malke Hansen - Victor Rufus

32

Painted some years after the Krakatoa eruption (Indonesia)

Iceland 2010

Nora Strotzjohann - Malke Hansen - Victor Rufus

33

Cooling Effect

Mauna Loa Observatory Atmospheric Transmission

Nora Strotzjohann - Malke Hansen - Victor Rufus

34

Cooling Effect

Composite global surface temperature change near the time of the five volcanos producing the greatest optical depths since 1880: Krakatau (1883), Santa Maria (1902), Agung (1963), El Chichon (1882) and Pinatubo (1991).

Nora Strotzjohann - Malke Hansen - Victor Rufus

35

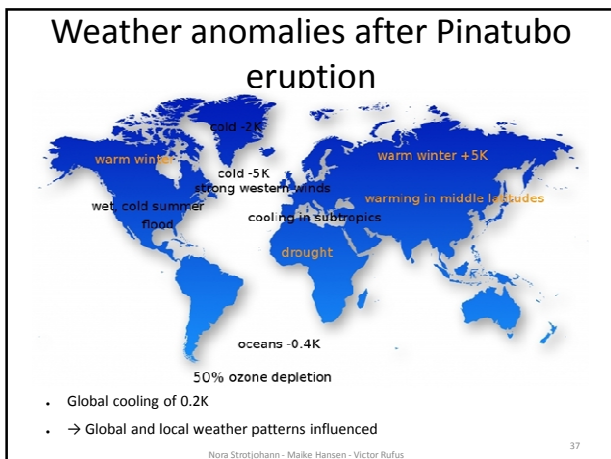

Sulfur deposition in Iceshields

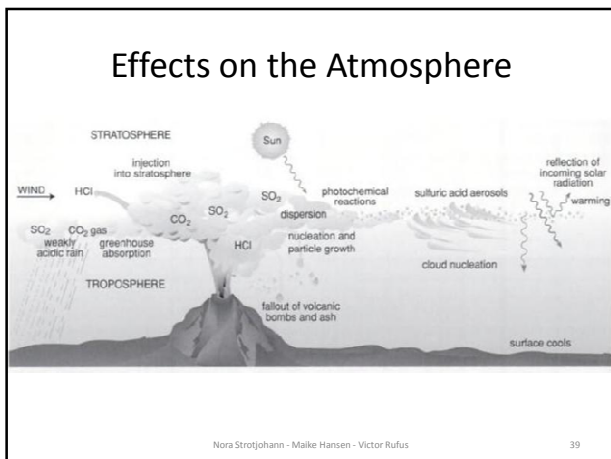

- Cores from Antarctic and Greenland
- 1815 Eruption of the Tambora (Indonesia)
- 1809 "Unknown Eruption"

Nora Strotzjohann - Malke Hansen - Victor Rufus

36

- ### Effect on Ozone Layer
- Ozone layer is in stratosphere (shields earth from UV radiation)
 - Natural balance disturbed by human-made chlorofluorocarbons (CFC)
 - Volcanic aerosols increase impact of CFCs
 - Pinatubo: ozone depletion by 50% over Antarctica
 - Recovers within some years
- Nora Strotzjohann - Malke Hansen - Victor Rufus 38

Super-Volcanoes

Nora Strotzjohann - Malke Hansen - Victor Rufus 40

- ### Super-Volcanoes
- Volcanoes that erupt more than 1 000 km³ of tephra (pumice and ash) in a single event
 - Eruptions 100 times stronger than normal eruptions
 - VEI > 7
- Nora Strotzjohann - Malke Hansen - Victor Rufus 41

Volcanic Explosion Index

VEI	Description	Plume	Frequency	Examples	Occurrences in last 10,000 years*
0	effusive	< 100 m	constant	Kilauea, Piton de la Fournaise	many
1	gentle	100-1000 m	daily	Stromboli, Nyiragongo (2002)	many
2	explosive	1-5 km	weekly	Galeras (1993), Mount Sinabung (2010)	3477*
3	severe	3-15 km	few months	Nevado del Ruiz (1985), Soufriere Hills (1995)	868
4	cataclysmic	10-25 km	≥ 1 yr	Mount Pelée (1902), Eyjafjallajökull (2010)	421
5	paroxysmal	20-35 km	≥ 10 yrs	Mount Vesuvius (79 CE), Mount St. Helens (1980)	166
6	colossal	> 30 km	≥ 100 yrs	Krakatoa (1883), Mount Pinatubo (1991)	51
7	super-colossal	> 40 km	≥ 1,000 yrs	Thera (Minoan Eruption), Tambora (1815)	5 (+2 suspected)
8	mega-colossal	> 50 km	≥ 10,000 yrs	Yellowstone (640,000 BP), Toba (74,000 BP)	0

Nora Strotzjohann - Malke Hansen - Victor Rufus 42

Super-Volcanoes

Nora Strotzjohann - Malke Hansen - Victor Rufus

43

Consequences of a Super-eruption

- Volcanic ash covers a large part of a continent
- **Climatic changes:** Aerosols and fallout in atmosphere for up to six years → atmosphere reflects solar radiation back and absorbs heat
→ cooling of 3-5K for Toba-like eruption
→ **Volcanic winter**

Nora Strotzjohann - Malke Hansen - Victor Rufus

44

Volcanic winter

Poyehue volcano erupts in Chile, June 2011, http://www.boston.com/bigpicture/2011/07/ash_covered_landscape.html

Nora Strotzjohann - Malke Hansen - Victor Rufus

45

Volcanic winter

- 1815 Mount Tambora in Indonesia (VEI=7)
→ frost and snow in summer in New England
- Super volcano eruption could reduce radiation of the sun by 25%

Nora Strotzjohann - Malke Hansen - Victor Rufus

46

Snowball experiment - 0% radiation

Without radiation
→ sea freezes totally within 15 years

<http://www.mpimet.mpg.de/en/science/Internal-projects/super-volcano/presentations.html>

Nora Strotzjohann - Malke Hansen - Victor Rufus

47

Consequences of a Super-eruption

- Climate system is complex → not sure whether observations from smaller eruptions can be extrapolated
- Maybe also other effects become important e.g. CO₂ and Methane concentration in the atmosphere, air pollution and ozone depletion
- Can produce huge hurricanes

Nora Strotzjohann - Malke Hansen - Victor Rufus

48

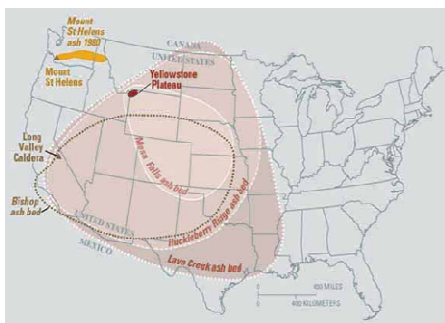

History

- Last super-eruption 640 000 BP
- Long thought to be extinct
- 1973 north of lake had risen 0.76m since 1923
- 1985 swarm of tiny earthquakes → volcano alive
- In the 1950s 3 ash layers found → sign of huge pyroclastic flows

Nora Strotzjohann - Malke Hansen - Victor Rufus

50

Ashlayers

Nora Strotzjohann - Malke Hansen - Victor Rufus

51

Future of Yellowstone

Simulation for a Yellowstone eruption

- Yellowstone eruption very unlikely but possible
- Ash would spread around the world
- Global cooling effect as seen for Pinatubo would be much larger → new ice age?

Nora Strotzjohann - Malke Hansen - Victor Rufus

52

Lake Toba (Sumatra, Indonesia)

Nora Strotzjohann - Malke Hansen - Victor Rufus

53

Lake Toba: Toba catastrophe

- Erupted 74 000 BP
- 300x stronger than Tambora eruption in 1815
- 6 - 10 years volcanic winter
- Genetic bottleneck theory : human population reduced to 10 000 or 1 000 pairs

Nora Strotzjohann - Malke Hansen - Victor Rufus

54

Conclusion and Findings

- Volcanic Eruption Emission and Ejecta
- Eruption Classifications
- Tectonic Plate Boundaries and Hotspots
- Impact on Global climate of Plinian eruptions of VEI>5
- Global cooling (eg. Pinatubo of 0.2K for approx. 3 yr)
- Complexity of climate systems, limited predictability
- VEI >7 Supervolcanoes
- Significant related climate changes
- Expected global cooling (3-5K for approx. >4 yr)

Nora Strotzjohann - Malke Hansen - Victor Rufus

55

*"The bright sun was extinguish'd and the stars
Did wander darkling in the eternal space,
Rayless, and pathless, and the icy earth
Swung blind and blackening in the moonless air;
Morn came and went - and came, and brought no day.."*

A section from "Darkness" by Lord Byron, written in June 1816 on the shores of Lake Geneva in the midst of the "Year without Summer", 14 months after the great eruption of the Tambora volcano in Indonesia.

Nora Strotzjohann - Malke Hansen - Victor Rufus

56
