

Theoretische Festkörperphysik/ Theoretical Condensed Matter Physics

Instructor: H. Kroha

Lectures: Tue 13:15 - 14:00, Thu 09:15 - 11:00 at HS I

Exercises: Fri 12:15 - 14:00, AVZ 22 (with T. Langenbruch), first exercise 25.04.2008

Certificates: Ungraded certificates will be assigned for attaining 50% of all possible homework points. For a graded certificate an oral exam at the end of the term is necessary.

Prerequisites: Quantum Mechanics I and II (second quantization)

Contents:

1. Quantum field theory at finite temperatures
 - Green's functions, correlation functions
 - Analytical properties: Matsubara technique
 - Relation to observable quantities (linear response theory)
 - Feynman diagrams and Wick's theorem
2. Landau Fermi liquid theory
 - Concept of continuity
 - Quasiparticle concept
 - Physical consequences: Fermi liquid relations
3. Basics of collective excitations
 - Phonons
 - Plasmons
4. Superconductivity
 - Concept of spontaneous symmetry breaking (Goldstone theorem, Higgs mechanism)
 - BCS theory
 - Mesoscopic superconductivity: penetration depth, superconductor-normal metal contacts: Andreev reflection
 - superconducting contacts: Josephson effects

5. Magnetism and strong correlations

- Quantum mechanical origin of magnetism
- Magnetic defects in metals: Kondo effect
- Concept of renormalization group
- Magnetic lattice systems:
- Types of magnetic coupling
 - Hund's rule: FM
 - exchange, superexchange, AFM
 - Dipole: FM
 - RKKY: FM, AFM
- Models: Heisenberg, Hubbard, t-J

6. Metal-insulator transition in strongly correlated systems

- Hubbard model
- Dynamical mean field theory (DMFT)

Important general concepts:

- Continuity: Quasiparticles
- Collective phenomena of many particles
- Spontaneous symmetry breaking: Discontinuity
- Renormalization: Strong correlations out of weak interactions

Literature:
